SUMMARY

Software engineer with a design background, based in Spain. I'm technical cofounder at Aithority, building an EU AI Act compliance SaaS. Outside that I build my own products: Kiblo, a dog-food iOS app live on the App Store in the US and Canada; Dross, a macOS and CLI tool that catches when frontend and backend silently drift apart; and a Formula 1 strategy agent that predicts race pace using a model trained on real telemetry. My design background shows in how I build: I care about the interface as much as the logic behind it. I use AI as a tool in my workflow, but I still write and review the code myself. Right now I'm filling gaps in React and TypeScript while working through the University of Helsinki's Python MOOC, since Python is where I've built the strongest foundation so far. In August 2026 I completed Google Cloud's Generative AI fundamentals and Anthropic's Claude Code in Action course.

SELECTED PRODUCTS | PROBLEMS SOLVED

Kiblo. Dog-owner iOS app live on the App Store in the USA & Canada.

TypeScript, JavaScript, React Native, Figma, RevenueCat, App Store Connect & Apple Dev Program. | <https://kiblo-web.vercel.app>

- Portions food based on the dog's weight, age and activity using the vet RER formula, not a guess; 7–14 day meal plans from 47 real recipes, reorder nudges linking straight to Amazon/Chewy.
- Home was noisy: homepage is a clean bowl; tips, details and extras live on the bowl's detail screen.
- Deterministic engine, not an LLM, for grams and feeding tips.
- RevenueCat said credentials were valid but would not connect: In-App Purchase key was correct; the App Bundle ID was not an exact match.

Dross. macOS + CLI code fixer app living on the local Mac.

Open Source. SwiftUI, TypeScript compiler API | Live — notarized DMG.

- Catches when frontend and backend silently stop agreeing, or hardcoded demo data reaches production — via the TypeScript compiler API, not regex.
- Notarized Mac app + CLI, open-sourced, shared on social media.
- <https://github.com/lopezsellesarnau-cmd/dross>

Formula 1 Strategy Agent. ML project.

Python, FastF1 API, scikit-learn, SQL/SQLite | Open source.

- RandomForest model trained on real FastF1 telemetry (Jeddah + Bahrain), evaluated on Suzuka — a race it never saw.
- Predicting each circuit's delta over its own baseline pace cut the error from 3.49s to 0.73s.
- Open-sourced after filming the build for social media; viewers asked for the repo.
- <https://github.com/lopezsellesarnau-cmd/F1-Strategy-Agent>

EXPERIENCE

Aithority. EU AI Act compliance SaaS

Technical Cofounder | May 2026 – Present

- Time-to-value was over 7 minutes. Three-step onboarding: connect M365, Google Workspace or an Anthropic/OpenAI admin key → auto-create the AI system → Haiku suggests a class, a human confirms → dashboard.
- UI is intentional: large popup, editorial-minimal. Product exports a PDF the customer can send so the SaaS is not only a classifier.
- Departments vanished on reload: Render's filesystem is wiped on cold start/redeploy. Moved the database to Turso instead of paying a higher Render tier. Sales: commercial cofounder.

Deutsche Post (DHL Group) — Logistics and operations

Paderborn, Germany | Aug 2024–Apr 2026 (~2 years)

- Full-time logistics operations role in the DACH region, real day-to-day exposure to how a major European logistics network actually runs.
- Alongside the job, built and launched my own Shopify store for beauty products targeting the Netherlands and Germany: first real product I ran solo, end to end.
- Based in Spain now, open to English-speaking backend/software engineer roles in NL / DE; German is A2.

HOW I USE AI

Loop engineering with AI: each pass has conditions; if they fail I inspect why and rebuild. I lock product and visual constraints; the model does not own the ship. I also use it to close gaps on technologies I'm still building speed on, like React, since as a junior I don't yet move fast through complex architectures on my own, so AI helps me get there faster. I use it the same way to find bugs and debug faster, which keeps my output moving.

SKILLS

Languages: TypeScript, JavaScript, Python, SQL, Swift, Dart.

Backend / data: Node, Express, SQLite/Turso, Firebase, Vercel, Render.

Product / UI: design systems, Figma to code, React, React Native, Expo, Next.js, SwiftUI, Flutter.

Spanish (native), Catalan (native), English (professional), German (A2).

STUDIES

University of Helsinki

Programming MOOC (Python) · in progress

Self-paced, university-affiliated introductory CS curriculum (programming-26.mooc.fi).

EASD Alcoy

Plastic Arts Technician and Layout Assistant for Printed Graphic Products | Sept 2021 – June 2023

Certifications

Anthropic, Claude Code in Action, Claude Academy (Aug 2026). Google Cloud Skills Boost, Generative AI fundamentals (Aug 2026).

Based in Alcoy, Spain. Open to relocation within the EU.
